# Chapter 1

## Introduction

### 1.1 Requirements

[1]

## Chapter 2

### GPS concept and error sources

# Chapter 3

## Accuracy enhancement systems

3.1 Code-Phase Differential GPS

3.2 Carrier-Phase Differential GPS

3.3 Carrier-Smoothed-Code Differential GPS

3.4 Satellite-Based Augmentation Systems (SBAS)

# Chapter 4

## Differential GPS concept for a sounding rocket

### Setup:

- Two M8T modules in the nosecone and one at the ground station.
- RF-uplink from ground station to rocket.

### Procedure:

- Ground station averages position measurements over a longer time to get reference position. This might not be the exact position, but this only results in a constant bias in the rockets absolute position. Reference position stays fixed when sending of differential corrections starts.
- Ground station calculates distance to each visible GPS satellite from reference position and ephemeris data.
- The difference between the calculated distance and the measured pseudorange is calculated for each satellite.
- The range differences are sent to the rocket over the RF-link. The update rate of the corrections could be about 1Hz.
- On the rocket, the pseudorange measurements are corrected with the latest differential corrections and a tropospheric model. The tropospheric corrections are zero at the launchpad and get bigger with altitude.

- The rocket position is then calculated with the corrected pseudoranges.
- The first correction is sent when the rocket is still on the launch pad. One or more corrected measurements at the launch pad serve as the zero point of the trajectory.
- The calculated position measurements during the flight can be differenced with the launch pad zero point to get the relative position to the launch pad. With this the reference position bias cancels out. For the rocket control and the post processing, the relative position to the launchpad is more relevant. The absolute position, where the reference position bias is still present, is only needed for the recovery of the rocket where accuracy is not as important.

# Chapter 5

## Implementation

## Chapter 6

### Testing and validation

# Chapter 7

## Conclusion
